

SEROLOGY EXAMINATION

Widal - Titre For Typhoid

Antigens	1:40	1:80	1:160	1:320
S. TYPHI "O"	Positive	Positive	Positive	Negative
S. TYPHI "H"	Positive	Positive	Positive	Negative
S. PARATYPHI "AH"	Negative	Negative	Negative	Negative
S. PARATYPHI "BH"	Negative	Negative	Negative	Negative

Diagnostic Impression : ↑ Positive Titre For Typhoid Fever

Interpretation:-

Typhoid fever is caused by the bacterium *Salmonella Typhi*, common in the developing world. The Widal test is positive if "O" antigen titer is $>1:160$ = active infection. Or "H" antigen titer is $>1:160$, indicate past infection or in immunized persons. Or Fourfold increase in the titer (e.g., from 1:40 to 1:160) is diagnostic. In the acute stage **Antigen O** will be positive and titer will be more than 1:160. **O** antigen appear early and also disappear early. **H** antigen rises late and disappear late. This will be positive in the recovery stage. **Vi antigen** is indicator of carrier stage. **False positive** test may be seen due to cross reacting infections, including malaria. Blood culture, which will be positive in the first week when Widal test is negative. Bone marrow culture This is very sensitive & definitivative test. As a **drawback**, this test will be positive after 7 to 10 days of **Enteric fever**
